1. About This Document

This document is the official integration guide for the Choice FinX Open API (Trading API) platform, published by Choice Equity Broking Pvt. Ltd. It is intended for:

- Technology Vendors and API partners who wish to integrate with Choice FinX on behalf of their clients.
- Direct Clients / Algo Traders who want to programmatically access their own Choice trading account.
- Business Development & Partnerships teams who need a single reference to share with prospective partners.

The guide covers regulatory context, user types, eligibility criteria, onboarding steps, API authentication modes, key management, do's and don'ts, and support contacts.

i This document must be read alongside the applicable NSE/SEBI circulars on Algorithmic Trading. The most recent consolidated circular is available at:
<https://nsearchives.nseindia.com/content/circulars/INVG69255.zip>

2. Regulatory Background & Compliance Framework

Choice Equity Broking Pvt. Ltd. is a SEBI-registered stock broker authorised to operate on NSE, BSE, and MCX exchanges. All API-based / algorithmic trading activities are governed by SEBI and exchange circulars.

2.1 Applicable Regulations

Regulator / Exchange	Circular / Rule	Relevance
SEBI	Circular on Algorithmic Trading	Framework for algo trading, risk controls
NSE	INVG69255 (latest consolidated circular)	Empanelment of Vendors, Strategy registration, Static IP mandate
BSE	Equivalent circular on Algo / API trading	Same framework applies on BSE segment
MCX	Circular on Commodity Algo Trading	Applies to commodity derivatives segment

2.2 Key Regulatory Requirements at a Glance

Requirement	Applicable To	Threshold / Condition
Static IP address mandatory	All API users (Vendors & Direct Clients)	All orders placed via API must originate from a declared static IP
Vendor Empanelment with Exchange	Vendors / Third-party platforms	Mandatory before going live; must be registered with NSE/BSE/MCX
Algo Strategy Registration with Exchange	All API users	Required if order rate exceeds 10 orders/second
Server co-location at broker site	Empanelled Vendors	Required when the vendor is fully empanelled with the exchange

⚠ Note: If your application sends fewer than 10 orders per second and you are a direct client (not a vendor), most exchange-side requirements are simplified. However, the Static IP mandate and API key discipline apply to everyone.

3. Who Can Use Choice Open APIs?

The Choice FinX Open API supports two distinct user categories. Understanding which category you fall into is the first step before any integration work begins.

3.1 Type A — Direct End Client (Algo Trader)

A direct client is an individual or institution who holds a trading account with Choice Equity Broking and wants to automate their own trading strategies.

Attribute	Details
Who is this?	Choice FinX account holder — individual retail or institutional investor
Primary use-case	Running personal algo strategies, automated rebalancing, systematic trading
Exchange empanelment required?	No (unless order rate > 10/sec, in which case strategy registration is needed)
Static IP required?	Yes — the client's own static IP must be declared
API key generation	Self-service via FinX website → Profile → Generate API Key
Order rate limit	Up to 10 orders/sec without strategy registration; above that requires exchange approval

3.2 Type B — Technology Vendor / Platform

A vendor is a third-party technology company or platform (e.g., Tradetron, AlgoTest, custom broker aggregator) that integrates Choice APIs to offer trading services to multiple Choice clients.

Attribute	Details
Who is this?	Fintech company, algo platform, or software vendor serving multiple Choice clients
Primary use-case	Multi-client algo platform, trading dashboards, order management systems
Exchange empanelment required?	YES
Static IP required?	Yes — the vendor's server static IP must be declared
Server location	Server should be co-located at broker (Choice) premises
API key type	Vendor ID + Vendor Key (issued by Choice Open API team after vetting)

Attribute	Details
Order rate	If any client strategy exceeds 10 orders/sec, that strategy must be exchange-registered

i If you are unsure which category applies to you, please reach out to the Choice Open API Support team before initiating any integration work.

4. Pre-requisites & Eligibility Checklist

Before you begin the onboarding process, ensure all the following pre-requisites are in place. Incomplete prerequisites will delay your go-live.

4.1 For Direct Clients

- Active trading account with Choice Equity Broking (live KYC).
- Login access to the Choice FinX web portal (finx.choiceindia.com).
- A static IP address provisioned by your Internet Service Provider (ISP).
- Basic understanding of REST API concepts and your chosen programming language.
- If order rate will exceed 10/sec — obtain exchange approval for the strategy first.

4.2 For Vendors

- Registered legal entity (company/LLP/partnership).
- Empanelment application filed with NSE/BSE/MCX (as applicable). Refer to NSE Circular INVG69255 for the empanelment process.
- Dedicated server with a static IP address (vendor infrastructure).
- Technical team capable of REST API integration and OAuth 2.0 implementation.
- Completed Choice Vendor Registration Form (link in Section 5).
- If any strategy exceeds 10 orders/sec — exchange approval for that strategy is mandatory.
- Server co-location at Choice premises (required upon full empanelment with exchange).

⚠ Note: Vendor empanelment with the exchange is a regulatory requirement. Choice cannot grant live production access to a vendor that has not completed exchange empanelment. Start the empanelment process in parallel with your technical integration.

5. Onboarding Process

5.1 Vendor Onboarding — Step-by-Step

Step	Action	Owner	Notes
1	Fill Vendor Registration Form	Vendor	Form link: https://bit.ly/choice-vendor-reg (Google Form)
2	Choice team reviews and creates UAT credentials	Choice Open API Team	Vendor ID + Vendor Key for UAT environment issued
3	API Documentation shared for UAT	Choice Open API Team	UAT docs: https://uat.jiffy.in/api/OpenAPI/Info
4	Vendor selects integration mode (oAuth or Non-Auth)	Vendor	See Section 6 for details on each mode
5	Vendor builds UAT integration	Vendor	Test all order types, error handling, and edge cases
6	UAT certification — submit for review	Vendor	Share integration demo / test logs with Choice team
7	Choice confirms successful UAT integration	Choice Open API Team	Written confirmation provided
8	Exchange Empanelment confirmation shared with Choice	Vendor	Mandatory before production keys are issued
9	Production Vendor ID + Key issued	Choice Open API Team	Live environment credentials shared securely
10	Go-Live	Vendor + Choice	Monitor first 48 hours; dedicated support contact active

5.2 Direct Client Onboarding — Step-by-Step

1. Log in to the Choice FinX web portal at finx.choiceindia.com.
2. Navigate to Profile (top-right avatar icon) → Settings → Generate API Key.

Figure 1 — FinX Profile Page: Click 'Generate API Key' in the left sidebar

Figure 2 — Choice Open APIs Page: The API key management dashboard

3. In the 'Generate New API Key' dialog, enter:
 - Application Name — a descriptive label for your integration (e.g., 'MyAlgoBot_v1').
 - Static IP — enter your static IP address. This is mandatory; orders from non-declared IPs will be rejected.
 - API Key Validity — select the validity period (1 Week, 1 Month).

Figure 3 — Generate New API Key: Enter Application Name, Static IP and Validity

- Click Generate API Key. The key will be displayed once — copy and store it securely.
- Download the Open API documentation from:
<https://finx.choiceindia.com/api/OpenAPI/Info>
- Integrate the API into your trading application using the documentation.
- Test in paper-trading/simulation mode (if available) before routing live orders.
- Go live. Monitor your application's behaviour and error rates.

i Direct clients access the Open API documentation via the FinX portal after generating their API key, or by contacting the Choice support team at openapi@choiceindia.com.

6. API Authentication Modes

Choice FinX Open API supports two authentication modes. Vendors must select one mode during onboarding; the choice affects how end-users authenticate and how sessions are managed.

6.1 OAuth Mode (Recommended for Vendors)

In OAuth mode, the vendor's platform redirects the end-user to the Choice FinX login page. After the user authenticates, an authorisation code is returned to the vendor's callback URL, which is then exchanged for an access token.

Attribute	Details
Best suited for	Vendors with a web application or mobile app (Tradetron-style platforms)
User experience	User clicks 'Connect Choice FinX' on vendor site → redirected to FinX login → authorised → redirected back
Session management	Access token + refresh token pattern; no static API key needed from user
Partner product option	Available under the 'Partner Product' section on the FinX website
Security	Higher security; credentials never exposed to vendor; token can be revoked anytime
Implementation complexity	Medium — requires standard OAuth 2.0 flow implementation

OAuth Flow Integration Guide

For the complete step-by-step guide on implementing the OAuth 2.0 flow with Choice FinX (redirect URLs, token exchange, refresh tokens), refer to the dedicated integration document below:

Document: <https://docs.google.com/document/d/1vtFIADLUONJRKsvcdnVIM2RIO-odmGm4btM6xHU-k-l/edit?tab=t.0>

6.2 Non-Auth (API Key) Mode

In Non-Auth mode, the end-user generates a static API key from their FinX profile and provides it directly to the vendor application (or uses it in their own integration). The API key acts as a long-lived credential.

Attribute	Details
Best suited for	Direct clients or vendors offering 'bring your own key' integrations

Attribute	Details
User experience	User generates API key on FinX portal → copies key → pastes into vendor app or own code
Session management	Single static key per application; validity selected at generation time
Static IP binding	Key is bound to the declared static IP(s); requests from other IPs are blocked
Security	Key must be stored securely by the user/vendor; rotation recommended on expiry or suspected compromise
Implementation complexity	Low — standard API key header authentication

7. API Key Management (Non-Auth Mode)

7.1 Generating an API Key

API keys are generated from the FinX portal under Profile → Settings → Generate API Key. The form requires:

- Application Name — unique label for the integration.
- Static IP — one or more static IP addresses from which API calls will originate.
- API Key Validity — the duration for which the key remains active.

⚠ Note: The API key is displayed only once at generation time. Copy it immediately and store it in a secure vault (e.g., AWS Secrets Manager, HashiCorp Vault, or an encrypted config file). Choice cannot retrieve or display the key again.

7.2 Key Validity Options

Validity Period	Recommended Use Case
1 Week	Short-term testing or proof-of-concept integrations
1 Month	Monthly strategy reviews; rotate frequently

7.3 Revoking / Regenerating a Key

If you suspect your API key has been compromised, or if your static IP changes:

9. Log in to FinX portal → Profile → Generate API Key.
10. Revoke the existing key from the API Key management table (Action column).
11. Generate a new key with updated details.
12. Update your application/vendor integration with the new key immediately.
13. Notify the Choice Open API Support team if you believe the key was used maliciously.

8. Static IP Policy

A Static IP address is a mandatory requirement for all API-based order routing on the Choice FinX platform. This is mandated by SEBI/NSE guidelines and is enforced at the platform level.

User Type	Whose Static IP to Declare	What Happens if IP Mismatch
Direct Client	Client's own ISP-issued static IP	Orders will be rejected;
Vendor	Vendor's server static IP	Orders will be rejected for all clients routed through that vendor server

- To obtain a static IP, contact your Internet Service Provider (ISP) or cloud provider. Dynamic IPs are not supported.
- If your server's IP changes (e.g., cloud instance restart), you must update the declared IP in your API key settings immediately and notify the Choice team.
- Multiple static IPs can be declared for a single API key (e.g., primary and failover servers).

⚠ Note: Using a VPN or proxy to route API calls through a different IP than the one declared will result in order rejection. Ensure your application connects directly from the declared static IP.

9. Order Rate Limits & Strategy Registration

SEBI and NSE regulations define order rate thresholds that determine whether a trading strategy must be registered with the exchange as an 'Algorithm'.

Order Rate	Regulatory Requirement	Action Required
< 10 orders/second	No algo registration required	None — proceed with standard API integration
>= 10 orders/second	Strategy must be registered as an Algorithm with the exchange	Submit strategy details to NSE/BSE for approval before deployment

These limits apply per strategy, per client. Aggregated order rates across multiple clients on a vendor platform should be managed to ensure no individual client strategy breaches the 10/sec threshold without prior registration.

i Strategy registration is done directly with the exchange (NSE/BSE/MCX). Choice Equity Broking will require proof of exchange approval for any strategy that routes >= 10 orders/sec before enabling it in production.

10. API Documentation & Environments

Environment	Base URL / Documentation	Purpose
UAT (Testing)	https://uat.jiffy.in/api/OpenAPI/Info	Sandbox for integration & testing; no real orders or money
Production (Live)	https://finx.choiceindia.com/api/OpenAPI/Info	Live trading; real orders; real funds

10.1 Available APIs

API Category	Key Endpoints	Description
Authentication	/login, /token/refresh	Session management, token issuance and refresh
Market Data	/quote, /depth, /ohlc, /instruments	Live quotes, order book depth, OHLC data, instrument search
Order Management	/order/place, /order/modify, /order/cancel	Place, modify, and cancel orders across segments
Portfolio	/positions, /holdings, /tradebook	Open positions, long-term holdings, completed trades
Funds	/funds/limits, /funds/summary	Available margin, fund utilisation, and ledger summary
WebSocket	wss://stream.jiffy.in/	Real-time streaming for quotes, order updates, and positions

Full endpoint documentation — including request/response schemas, error codes, and code samples in Python, JavaScript, Java, and cURL — is available in the linked documentation portal.

10.2 Live API Documentation & Postman Collection

The official live API documentation is hosted on the Choice FinX developer portal and includes complete endpoint specifications, request/response schemas, authentication details, and interactive testing via Swagger UI.

Live API Docs (Production): <https://finx.choiceindia.com/api/OpenAPI/Info#section/Introduction>

Postman Collection

A Postman collection is available to accelerate your integration testing. It includes pre-built requests for all major API endpoints with sample payloads and environment variables. Download and import the Postman collection from the API documentation request it from openapi@choiceindia.com.

Configure environment variables: API_KEY (your generated key), BASE_URL (UAT or production), and STATIC_IP.
Use the collection to test authentication, orders, market data, and portfolio endpoints before going live.

10.3 Additional Integration Guides

The following dedicated guides cover specific integration patterns available on the Choice FinX platform. Refer to the relevant document based on your use-case:

1. OAuth Flow Integration

Step-by-step implementation of the OAuth 2.0 authorisation flow — redirect URLs, authorisation code exchange, access token management, and refresh token handling.

Document: <https://docs.google.com/document/d/1vtFIADLUONJRKsvcdnVIM2RIO-odmGm4btM6xHU-k-l/edit?tab=t.0>

2. Webhook Integration

Integration guide for the OpenTransactionPusher webhook service. Subscribe to real-time push notifications for order status updates, trade confirmations, and position changes — without polling the API.

Document: <https://finx.choiceindia.com/api/OpenTransactionPusher/docs/index.html>

3. Interactive Socket Integration

Guide for establishing and managing a persistent WebSocket connection for real-time streaming of live market quotes, order book depth, and position updates.

Document: https://docs.google.com/document/d/1wIptRZZYr0dgQiqX_FvnFap8KDo-vtG0J2GVa1XMQkg/edit?usp=sharing

11. Do's and Don'ts

11.1 Do's

- Always use your declared static IP when making API calls.
- Store API keys and OAuth tokens in secure, encrypted storage — never in plain text files or source code.
- Rotate API keys periodically (at least every 3 months for production).
- Implement proper error handling and exponential back-off for retries.
- Test all edge cases (market close, holiday, circuit breaker) in UAT before going live.
- Register your strategy with the exchange if your order rate will reach or exceed 10 orders/second.
- Vendors: complete exchange empanelment before requesting production credentials.
- Monitor your integration for unexpected order bursts or errors and alert the Choice support team immediately.
- Maintain your own audit logs of all API requests and responses for compliance purposes.
- Ensure your server clock is synchronised (NTP) to avoid timestamp-related order rejections.

11.2 Don'ts

- Never share your API key or OAuth token with anyone, including Choice support staff (they will never ask for it).
- Do not hard-code credentials in application source code or commit them to version control (Git, etc.).
- Do not use a VPN or proxy that changes your outbound IP to a non-declared IP when making API calls.
- Do not use dynamic IPs — all API calls must originate from the declared static IP only.
- Do not attempt to bypass rate limits by creating multiple API keys for the same application.
- Do not route live client orders without completing UAT certification and receiving production credentials from Choice.
- Do not make API calls on behalf of a client without their explicit consent and proper authorisation flow.
- Do not ignore API error responses — treat all 4xx/5xx errors as actionable; do not silently retry indefinitely.
- Vendors: do not go live on production before receiving written confirmation from the Choice Open API team.

⚠ Note: Violation of the above guidelines may result in immediate suspension of API access, regulatory reporting, and potential legal consequences under SEBI regulations. Choice Equity Broking reserves the right to suspend access without prior notice in case of suspected misuse.

12. Security Guidelines

Protecting the integrity of API credentials and order flow is a shared responsibility between Choice Equity Broking and the API user. The following practices are strongly recommended.

Security Area	Best Practice
Credential Storage	Use environment variables or a dedicated secrets manager (AWS Secrets Manager, HashiCorp Vault, Azure Key Vault).
Transport Security	All API calls must be made over HTTPS (TLS 1.2 or higher). HTTP connections are rejected.
Token Expiry	Implement token refresh logic to avoid session interruptions during trading hours.
IP Whitelisting	Declare only the minimum necessary IPs; review and update the list if your infrastructure changes.
Incident Response	If a key is compromised, revoke it immediately, rotate to a new key, and notify openapi@choiceindia.com .
Logging	Log all API calls with timestamps, request IDs, and response codes. Retain logs for at least 5 years (regulatory requirement).
Access Control	Limit internal access to API credentials on a need-to-know basis; use role-based access control (RBAC) in your systems.

13. Support, Escalation & Turnaround Times

13.1 Support Team Structure

The Choice Open API support team uses a three-level escalation model. Always start with L1 and escalate only if the issue is not resolved within the stated SLA.

Level	Name	Role / Responsibility	When to Contact
L1 — First Response	Dilip Yadav	Initial intake, basic troubleshooting, UAT support, API key issues, documentation queries	All new issues — first point of contact
L2 — Technical Escalation	Ganesh Gavande	Deep technical issues, integration failures, environment problems, UAT certification review	Escalate if L1 cannot resolve within SLA
L3 — Management Escalation	Ranjeet Yadav	Critical production incidents, regulatory queries, go-live approvals, vendor onboarding sign-off	Escalate only for P1 production incidents or formal approvals

Note: Always provide your Vendor ID / Client ID, issue description, request/response payloads (sanitised — remove API keys), and timestamps when raising a support request.

13.2 Contact Details

Contact Type	Channel	Details
Open API / Technical Support (L1)	Email	openapisupport@choiceindia.com
Vendor Registration & Onboarding	Google Form	https://docs.google.com/forms/d/e/1FAIpQLSdsdEibgCX1MsLcYmQy7AknLTiyp6fYZccgSJFU7qFVPzy1EA/viewform
General Broker Support	Phone	+91-22-6919-5503 (Trading hours: 9 AM – 6 PM IST, Mon–Fri)

13.3 Turnaround Times (TAT)

The following TATs are committed from the time a complete and valid request is received:

Activity	TAT	Starting Point	Notes
UAT Credentials after Google Form submission	2 Business Days	From time completed Google Form is received	Form must include: entity name, contact, integration type, static IP
UAT Integration Review & Certification	2 Business Days	From time vendor submits integration completion confirmation	Include test logs, demo video, or test report
Production / Live Credentials issuance	1 Business Day	From UAT certification + exchange empanelment proof received	Both conditions must be met simultaneously

L1 Support Query Response	1 Business Day	From time email received at openapi@choiceindia.com	Complex issues may be escalated to L2
L2 Technical Issue Resolution	2 Business Days	From time issue is escalated to L2	Major defects may require additional time
P1 Production Incident Acknowledgement	2 Hours	From P1 email received during trading hours (9AM–6PM IST)	Resolution TAT depends on incident severity

TATs are in business days (Mon–Fri, excluding NSE/BSE market holidays). Requests received after 5 PM IST are treated as received the next business day.

14. Glossary

Term	Definition
Algo Trading	Automated trading using pre-programmed instructions executed via software without manual intervention.
API Key	A unique alphanumeric credential used to authenticate API requests in Non-Auth mode.
Empanelment	Formal registration and approval of a vendor/platform by a stock exchange to offer algo trading services.
oAuth 2.0	An open standard for access delegation, allowing users to grant third-party applications limited access to their accounts.
Static IP	A fixed, non-changing internet protocol address assigned by an ISP or cloud provider.
Strategy Registration	The process of registering an algorithmic trading strategy with the exchange when order rate $\geq 10/\text{sec}$.
UAT	User Acceptance Testing — sandbox environment for integration testing before going live.
Vendor ID / Vendor Key	Unique credentials issued by Choice to a technology vendor for accessing the Open API in UAT and production.
WebSocket	A protocol providing full-duplex communication over a single TCP connection, used for real-time market data streaming.
SEBI	Securities and Exchange Board of India — the apex regulator for securities markets in India.
NSE	National Stock Exchange of India — one of the primary exchanges where Choice is a registered member.
BSE	Bombay Stock Exchange — another primary exchange where Choice is a registered member.
MCX	Multi Commodity Exchange of India — commodity derivatives exchange where Choice is a registered member.
