

Login Flow:

1. Vendor will have its own platform (web / app) which will have a button to navigate to broker's website
2. On click of that button user will be redirected to Choice portal
3. Url which needs to be used on click will be as follows
(<https://partner.choiceindia.com/auth/login?redirectUrl=>) where the value of **redirectUrl** will be vendors expected page post successful login
4. On successful login & authentication user will be redirected to vendors callback url shared in point 3
5. Query params which will be passed in vendor callback url are as mentioned below:

Query Param	Purpose	Value
cid	used to fetch details based on client id	Logged in users client id
sid	used to authenticate user which will be used in further api's for authentication	Logged in users session id
accessToken	Required for interactive socket integration	Logged in users 2FA access token
baseUrl	API base url to be used further for choice API integration Example: https://finx.choiceindia.com/api/Login In this " https://finx.choiceindia.com/ " will be passed in baseUrl key rest needs to be used as per API url Please note this won't be AES encrypted it will be in plain text	Domain of API urls

6. All above query params values to be passed in AES encrypted format which is vendor specific & will be shared once integration is started same will be shared by our IT team once integration has started

Requirements to be fulfilled by Vendor:

1. Callback Url to be provided prior
2. Dev / UAT / Live environments if any to be provided prior
